                                                                                                                                                                                                                                                                                                                                                                 ÷
                                                                                                                                                                                            The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /mod_base= OTHER

                                                                                                                                                                                                                 The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Phosphorothioate backbone. The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /mod base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                  The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTMIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTMIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "OTHER= Phosphorothioate backbone. All cytidines are 5-methylcytidines"

The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to an isolated human protein with cancersuppressing function (HOMO). The protein, its encoded polynucleotide and antagonist are applicable in diagnosis and treatment of various diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human protein with cancer-suppressing function, encoded polynucleotide and antagonist, applicable in diagnosis and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              e.g. cancer, The present sequence represents a primer of the invention.

                                                                                                                                                                                                                                              ö
                                                           The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human PCTAIRE protein kinase 2 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "OTHER= Phosphorothioate backbone.                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method for detecting a specific white rot fungi strain from white rot fungi present in soil. The method comprises: obtaining a soil sample; recovering DNA from the soil using an elution buffer; purifying the DNA; preparing the DNA sample; determining strain specific base sequence in the genome DNA of the white rot fungi strain; preparing a primer; performing amplification using the prepared primer and the DNA sample as a template, and detecting the amplified white rot fungi strain DNA. The method enables detection of the specific white rot fungi strain from the white rot fungi strain from the white rot fungi strain from the white rot fungi present in the soil. This polymucleotide sequence represents a primer used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Aspergillus; internal transcribed spacer; ITS; ITS1-V1; ITS-V2; ITS-V3;
                                                                                                                                                                                                                                                                                                                                   Detecting specific white rot fungi strain, comprises obtaining soil, recovering DNA using elution buffer, preparing DNA sample and primer, performing amplification using DNA sample as template and detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a method for distinguishing species of
Aspergillus from one another, comprising detecting differences in two or
more internal transcribed spacer (ITS), i.e. ITS1-V1, ITS-V2, ITS-V3, ITS
-V4 and ITS-V5, nucleic acid sequences of Aspergillus. The internal
transcribed spacer 1 nucleic acid sequences are useful for distinguishing
species of Aspergillus from one another, or for detecting the presence of
species of Aspergillus from an another, or for detecting the presence of
invention, a biological sample was obtained from an infected subject, and
invention, a biological sample was obtained from an infected subject, and
invention, a biological sample was obtained from an infected subject, and
isolation of fungal DNA. The universal pairs internal transcribed spacer
(ITS)s and ITS2, ITSS and ITS4, ITS1 and ITS2, or ITS1 and ITS4 were
added to the reaction mixture to amplify the fungal DNA present in the
mixture. PCR products generated with the primer pairs were purified, and
the purified products were sequenced on both strands using the same
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                primers as initially used for PCR amplification. Sequencing products were purified and analysed on an automated capillary DNA sequencer. A total of 46 ITS1 consensus sequences ranging in length from 142-187 nucleotides were compiled. Overall, 5 regions with significant interspecies variability in length and sequence were recognised. The current sequence represents the nucleic acid sequence of a fungal universal forward

The invention relates to a method for distinguishing species of
Aspergillus from one another, comprising detecting differences in two or
more internal transcribed spacer (ITS), i.e. ITS1-V1, ITS-V2, ITS-V3, ITS-V3, ITS-V3, TS-V3, TS-
                                                                                                                                                                                                                                                                                                                        Use of internal transcribed spacer 1 nucleic acid sequences, for distinguishing species of Aspergillus from one another, or detecting the presence of an Aspergillus species or strain of a species in a biological

for factor VII-related disorders. Additionally, factor VII proteins containing at least one allelic variation of the invention (e.g., one which increases plasma stability) are useful as pharmaceuticals for treating disorders of blood coagulation or thrombosis. The present sequence represents a specifically claimed allelic variant-specific oligonuclectide probe, which was also used as a PCR primer in an example New allelic variants of the factor VII gene, useful in diagnosing predisposition to cardiovascular disease and for treatment of e.g. coagulation disorders and thrombosis. The invention relates to a human factor VII (FVII) polynucleotide (PRIV-) FUNDACIO PRIVADA I INST RECERCA LHOSPITA. Soria Fernandez JM, Claim 7; SEQ ID NO 36; 32pp; Spanish. 25-JUL-2002; 2002ES-00001749. WPI; 2004-143875/14 Fontcuberta Boj J, of the invention.

Human GPCR 12 antisense oligonucleotide ISIS238089.

Human, 88, antisense gene therapy, G protein-coupled receptor 12, GPCR 12, appetite control, nootropic, neuroprotective, neuroendocrine system disorder, signal transduction disorder; neuronal disorder; motor disorder; sensory disorder; psychiatric disorder; behavioural disorder.

Homo sapiens.

/mod_base= OTHER /note= "All cytidines are 5-methylcytidines and all Location/Qualifiers Д 1. .20 /*tag= modified base

stability and/or function of the gene or of the encoded factor VII. 49 stability and/or function of the gene or of the encoded factor VII. 49 catorial or via a stability and/or function of the gene or of the encoded factor VII. 49 cator VII allele with a so include insertions, are tabulated in the specification and are indicative of a predisposition to cardiovascular disease. Factor VII activates the coagulation cascade after it binds to tissue factor, via the encoding it is located on chromosome 13q34-qter. The invention also relates to 36 oligonucleotide or probes specific for the variant factor VII alleles (AbL06730-AbL06765), a process for testing for the presence of any of the 49 variations, and a diagnostic kit which contains the allele-specific oligonucleotides. The method of the invention can be used to detect the presence of variant cator VII alleles, and thus to determine whether an individual has a predisposition to cardiovascular disorders. Analysis of the factor VII alleles variations will permit the design of patient-specific treatments

```
/note= "This oligonucleotide has a phosphorothioate backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all
                                                                                                                          Antilipaemic, Cardiovascular, Analgesic, Antianginal, Antisense therapy, Human, Endothelial Lipase, dyslipidaemia, high density lipoprotein, HDL, cardiovascular disorder, metabolic syndrome X; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding GPCR-12 (protein-coupled receptor 12), and inhibits the expression of GPCR-12, i.e. an antisense oligonucleotide (AS). Also are a compound 8-80 nucleobases in length that specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding GPCR-12, a composition comprising the compound and a carrier or diluent, inhibiting the expression of GPCR-12 in cells or tissues with the compound so that expression of GPCR-12 is inhibited), treating an animal having a disease or condition associated with GPCR-12 (by administering to the animal at the rapeutic or prophylactic amount of the compound (by contacting a preferred target region of a nucleic acid molecule encoding GPCR-12 with one or more candidate antisense compounds that inhibit or and selecting for one or more candidate antisense compounds that inhibit the expression of a nucleic acid encoding GPCR-12). The compound, composition and methods are useful for treating a disease or condition and methods are useful for treating a disease or condition in present compounds that inhibit composition and methods are useful for treating a disease or condition and methods are useful for treating a disease or condition and methods are useful for treating a disease or condition in tissue, and selecting the system of a disease or condition in breat tissue, and selecting the system or an advance of the preferred target region and methods are useful for treating a disease or condition in tissue, and selecting the system of the preferred target and preferred target and part of the preferred target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding G protein-coupled receptor 12 (GPCR-12), useful for treating diseases of the neuroendocrine system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       οŧ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                neuroendocrine system, or aberrant signal transduction in brain tissue, or a disease or condition involving the neuronal, motor, sensory, psychiatric or behavioural disorder and in appetite control. They are also useful in research and diagnostics for modulating the expression of GPCR-12. The present sequence is an antisense oligonucleotide targeting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ٠;

New antisense oligonuclectide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy;
                                                                                                                                                                                 The present invention relates to antisense oligonucleotides (AbJ21603-AbJ25510) targeted to human Endothelial Lipase (EL) coding sequence (AbJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                         used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human endothelial lipase antisense oligonucleotide, SEQ ID 803.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                    /note= "This oligonucleotide has a phosphorothioate backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to antisense oligonucleotides (AbJ21603-AbJ25510) targeted to human Endothelial Lipase (EL) coding sequence (AbJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

nucleic acid molecule encoding Navi.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navi.3. The compound and composition are useful for treating a disease or condition associated with Navi.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy arthritic pain, lower back pain, abain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder; including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothhoate oligomucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navi.3 expression, the oligomucleotides are designed to target different regions of the human Navi.3 RNA.
                                  Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound targeted to a nucleic acid molecule encoding Navl.3, useful for useful for treating a disease or condition associated with Navl.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
and 3' ends, which are 4 nucleotides in length. Also all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells dyslipidaemia, low high density lipopototic (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to antisense oligonucleotides (ADJ21603-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

ö
specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3. e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder such as childhood seizure disorder such se childhood seizure disorder including sequence represents a chimeric phosphorothioate oligomucleotide with 2.MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligomucleotides are designed to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human vascular endothelial growth factor (VECF) corregulated chemokine-1 (VCC-1), and which specifically hybridises with and inhibits the expression of VCC-1. The invention also relates to a composition comprising the antisense compound, a method of inhibiting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunological disorder; cardiovascular disorder; neurological disorder; ischaemia; reperfusion injury; cancer; angiogenic disorder; haemangioma; tumour angiogenesis; rheumatoid arthritis; atherosclerosis; psoriasis; fibrosis; myocardial infarction; wound healing; bone fracture;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human VEGF co-regulated chemokine-1 DNA antisense oligonucleotide #441.
                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compounds targeted to a nucleic acid molecule encoding vascular endothelial growth factor co-regulated chemokine-1 (VCC-1), useful for treating VCC-1-associated disorders, e.g. diabetes or a neurologic disorder.
                                                                                                                                                                                                                                                                                                                                                                         .;

expression of VCC-1 in cells or tissues comprising contacting the cells or tissues with the antisense compound and a method of treating a human having a disease or condition associated with VCC-1 comprising administering the antisense compound to an animal to inhibit expression of VCC-1. The antisense oligomuclectide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, and at least one modified nucleobase, specifically a 5-methylcytosine. The antisense compound is useful for it a chimeric oligomucleotide. The antisense compound is useful for treating a disease or condition associated with VCC-1, such as diabetes, an immunological disorder, a cardiovascular disorder, a neurological disorder, a cardiovascular disorder, an enuclogical disorder, a cardiovascular disorder or an anglogenic disorder, ischaemia, reperfusion injury, cancer or an anglogenic atherosclerosis, psociasis or tibrosis after myocardial infarction. VCC-1 antisense oligomucleotides may also be used for wound healing, for regeneration of the part of the contraction of contraction of contracting of contraction of contraction of contraction of contraction of

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human vascular endothelial growth factor (VEGF) coregulated chemokine-1 (VCC-1), and which specifically hybridises with and inhibits the expression of VCC-1. The invention also relates to a composition comprising the antisense compound, a method of inhibiting the expression of VCC-1 in cells or tissues compound and a method of treating the cells or tissues with the antisense compound and a mathod of treating a human core expression of VCC-1. The antisense compound to an animal to inhibit expression of volving a disease or condition associated with VCC-1 comprising a human core of VCC-1. The antisense oligoncolectide comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified moiety, and at least one modified molectide. The antisense oligonucleotide. The antisense oligonucleotide of comprises of comprises of comprises of condition associated with VCC-1, such as diabetes, an immunological disorder, a cardiovascular disorder, a neurological disorder, a cardiovascular disorder, a neurological disorder, a cardiovascular disorder, an englogenic disorder, e.g. haemangioma, tumour angiogenesis, rhemmatoid arthritis, continense oligonucleotides may also be used for wound healing, for treatment of this sequence represents an antisense consense oligonucleotides may also be used for wound healing, for treatment of lung or liver fibrosis or for management of atrial fibrillation. This sequence represents an antisense oligonucleotide targeted to DNA encoding the human VCC-1 polypoptide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; NOVX; cancer; diabetes; cardiomyopathy; atherosclerosis; PCR;

Also included are the mature NOVX proteins (and their encoding polynucleotides), a vector comprising NOVX NA, a call comprising the vector, an antibody that binds immunospecifically to NOVX, determining the presence or amount of NOVX in a sample, determining the presence or amount of NOVX in a sample, determining the presence or modulating the activity of NOVX, treating or preventing a NOVX-associated disorder, determining the presence of or predisposition to a disease associated with altered levels of NOVX and treating a pathological state in a mammal comprising administering a polypeptide which is at least 95% identical to NOVX (or fragment). NOVX and NA may be used in the prevention, treatment and diagnosis of disease associated with Wolenc AR, Pena CEA; , Rieger DK, Burgess CE; inappropriate expression and activity of NOVX (e.g. cancer, diabetes, cardiomyopathy and/or atherosclerosis). The anti-NOVX antibodies and antagonists may also be used to down regulate expression and activity of NOVX. The anti-NOVX antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples (e.g. by enzyme linked immunosorbant assay (ELISA). The agents and methods may be used in this way to prevent, diagnose and treat cancer, diabetes, cardiomyopathy and/or atherosclerosis. The present sequence is a real time quantitative PCR (RTQ PCR) primer for tissue specific expression studies for a NOVX /mod_base= OTHER /note= "Phosphorothioate backbone in which all cytidines Isolated NOVX polypeptides and polymucleotides, useful for preventing diagnosing and/or treating cancer, diabetes, cardiomyopathy and atherosclerosis. composition comprises antisense oligomodeotides targeted to SPS2 gene. The antisense oligomodeotide is useful for modulating the expression of SPS2 in cells or tissues to treat diseases associated with their expression, e.g. rheumatoid arthritis, infections, inflammation or tumours. It is also used for diagnostics, prophylaxis, or as research therappy. The present sequence is an antisense oligomodeotide targeted to human SPS2 DNA. This sequence is used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                          ·.
                                                                                                                                                      This invention describes novel antisense oligonucleotides targeted to a nucleic acid encoding PPAR-delta, which specifically hybridise to and inhibit expression of PPAR-delta, The oligonucleotide specifically hybridises with at least an 8-nucleobase portion of an active site on the nucleic acid molecule encoding the PPAR-delta and comprises at least one modified internucleoside linkage, which is a phosphorothicate linkage, at least one modified sugar moiety, which is a 2-0-methoxyethyl sugar. The antisense oligonucleotides are useful for preparing a composition for treathing hyperproliferative disorders, e.g., cancer. The oligonucleotides of the invention have cytostatic activity and can be used for gene

nucleic acid encoding PPAR delta, which specifically hybridise to and inhibit expression of PPAR-delta. The oligonucleotide specifically hybridises with at least an 8-nucleobase portion of an active site on the nucleic acid molecule encoding the PPAR-delta and comprises at least one modified internucleoside linkage, which is a phosphorothicate linkage, at least one modified sugar moiety, which is a 2'-0-methoxyethyl sugar moiety or at least one modified nucleobase, which is a 5-methylotycsine. The antisense oligonucleotides are useful for preparing a composition for
                                                                                                                                                                                                                                                                                                                                                    treating hyperproliferative disorders, e.g., cancer. The oligonucleotides of the invention have cytostatic activity and can be used for gene

invention also relates to a pharmaceutical composition comprising the oligonucleotide (s) or its bioequivalent and a pharmaceutical carrier, a method of treating an animal having, suspected of having or prone to having a hyperproliferative disease, a method of modulating the expression of a JNK protein in cells or tissues, a method of modulating the expression of a cellular protein phosphorylation of a protein phosphorylation of a protein phosphorylation of a cellular protein that promotes one or more metastatic events in cultured cells or the cells of an animal, a method of inhibiting the growth of a tumour in an animal, a method of inducing apoptosis in a cell, a method of treating a human having a disease or condition associated with a JNK protein. The oligonucleotide and composition are useful in diagnosing or treating a disease or condition are useful in diagnosing or treating a disease or condition are useful in disease or condition (e.g. prostate cancer), a disease or condition associated with a JNK protein (e.g. inflammation, fibrosis), a fibrosis, conjunctival scarring) or a hyperproliferative disease or condition (e.g. conjunctival scarring) or a hyperproliferative disease or condition (e.g. conjunctival scarring) or a hyperproliferative disease or condition (e.g. cencer), or in inhibiting the growth of a tumour. The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mEGES-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, continhimanological, immunomodulatory and cardiovascular activities, and can be used for preparing a omposition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's condition associated with mPGES-1 e.g., inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGBS-1; mPGBS-1; inhibitor; microsomal prostaglandin E2 synthase; inhibitor; cytostatic, antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiant; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; acadiovascular disorder; neurological disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gierse JK;
The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human microsomal prostaglandin E2 synthase (mPGES-1). The human microsome is located on chromosome 9; more specifically to operate the present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding meGES-1, which specifically hybridise with the nucleic acid meGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal can anisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antisense compounds continual antisense compounds of antishflammatory, neuroprotective, nootropic, antishflatmic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound contition associated with mPGES-1 e-g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischemia or reperfusion injury, or condition associated with mPGES-1 e-g., inflammation reperfusion injury, or condition immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, famunomodulator, cardiant, neuroprotective, vasotropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGRS-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9334.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric
                                                                                                      New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The antisense oligonucleotides are useful for treating a disease or condition associated with cyclin-dependent kinase 6, such as a hyperproliferative disorder (e.g. cancer), or conditions arising from bacterial or viral infections, or involving aberrant apoptosis. They are also useful in research and diagnostics for modulating the expression of cyclin-dependent kinase 6. The present sequence represents a cyclin-

The antisense oligonuclectides are useful for treating a disease or condition associated with cyclin-dependent kinase 6, such as a hyperproliferative disorder (e.g. cancer), or conditions arising from bacterial or viral infections, or involving aberrant apoptosis. They are also useful in research and diagnostics for modulating the expression of cyclin-dependent kinase 6. The present sequence represents a cyclindependent kinase 6 antisense oligonuclectide. Note: Seqid 15-134 are also used in the sequence listing but these sequences do not match seqid 15-134 are also 134 displayed in Tables 1 and 2 (page 30-34).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
dependent kinase 6 antisense oligonucleotide. Note: Segid 15-134 are also used in the sequence listing but these sequences do not match segid 15-134 displayed in Tables 1 and 2 (page 30-34).
                                                                                                                                                                                                                                                                                            Gaps

The invention relates to antisense oligonucleotides targeted to cyclindependent kinase 6, and which inhibit the expression of cyclindependent kinase 6. The antisense oligonucleotides are useful for treating a disease or condition associated with cyclin-dependent kinase 6, such as a hyperproliferative disorder (e.g. cancer), or conditions arising from pacterial or viral infections, or involving aberrant apoptosis. They are also useful in research and diagnostics for modulating the expression of cyclin-dependent kinase 6. The present sequence represents a cyclindependent kinase 6 antisense oligonucleotide. Note: Seqid 15-134 are also used in the sequence listing but these sequences do not match seqid 15-134 displayed in Tables 1 and 2 (page 30-34).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "Phosphorothioate backbone. The invention relates to a compound targeted to a nucleic acid molecule encoding the human PIM-1 polypeptide. The compound is an antisense oligomucleotide that specifically hybridises with the mucleic acid and inhibits expression of the polypeptide. The antisense oligomucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloryosine. The antisense compounds are useful for modularing the expression of the human PIM-1 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence repersents a human PIM-1 DNA antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New compound that modulates PIM-1 expression, useful in treating an animal having a disease or condition, i.e. hyperproliferative disorder.
                                                                                                                                                                                                                   Human; PIM-1; ss; antisense oligonucleotide; phosphorothioate linkage;
2'-0-methoxyethyl sugar moiety; 5-methylcytosine;
hyperproliferative disorder; cancer; cytostatic.

The invention relates to a compound targeted to a nucleic acid molecule encoding the human PIM-1 polypeptide. The compound is an antisense oligonucleotide that specifically hybridases with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a posphorothhoate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human PIM-1 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence repersents a human PIM-1 DNA antisense oligonucleotide target region of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       detection; fungal infection; soil fungal infection; vegetable fungal infection; pathogenic fungus; Microcentrospora acerina; Fibularhizoctonia carotae; Pythium; hybridisation; primer; ss.
                                                                                                                                                                                                                                                                                                                                          New compound that modulates PIM-1 expression, useful in treating an animal having a disease or condition, i.e. hyperproliferative disorder.
Human; PIM-1; ss; antisense oligonucleotide; phosphorothioate linkage;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fungi, oomycete and plant general hybridisation primer B SEQ ID NO:30.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.8%; Score 14.2; DB 1; Length 20; 84.2%; Pred. The present invention describes an assay for detecting fungal infection of soil or vegetables by pathogenic fungal species, particularly Microcentrospora acerina, Fibularhizoctomia carotae or Pythium species. The assay comprises: (1) obtaining a sample of soil or vegetable; (2) treating the sample to lyse fungal cells; (3) effecting a PCR on DNA celeating DNA fragments generated by the PCR. Also pair; and (4) detecting DNA fragments generated by the PCR. Also described: (1) an 18-24-mer oligonucleotide primer by described: (1) an 18-24-mer oligonucleotide primer; (3) a substrate oligonucleotide sequence selected from SEQ ID NO:1 to 28; (2) a substrate oligonucleotide and mobblised on it the 18-24-mer oligonucleotide primer; (3) a primer composition comprising a pair of 18-24-mer oligonucleotide primers; (4) a kit for performing the assay method, for nucleic acid extraction from host vegetable tissue. The assay is useful for detecting fungal correction of soil or vegetables by pathogenic fungal species, infection of soil or vegetables by pathogenic fungal species. The present sequence represents a general primer which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0

The present invention describes an assay for detecting fungal infection of soil or vegetables by pathogenic fungal species, particularly conscient of species, particularly secretar or pertain species.

Microcentrospora acerina, Fibularhizoctonia carctae or Pythium species. The assay comprises: (1) obtaining a sample of soil or vegetable; (2) treating the sample to lyse fungal cells; (3) effecting a PCR on DNA treating DNA fragments generated by the PCR. Also described: (1) an 18-24-mer oligomucleotide primer and (4) detecting DNA fragments generated by the PCR. Also oligomucleotide sequence selected from SEQ ID NO:1 to 28; (2) a substrate conjugant inmobilised on it the 18-24-mer oligomucleotide primer; (3) at primer composition comprising a pair of 18-24-mer oligomucleotide primer; (3) a kit for performing the assay method, for nucleic acid extraction from host vegetable tissue. The assay is useful for detecting fungal infection of soil or vegetables by pathogenic fungal species. The present sequence represents a general primer which can hybridise to DNA from all fungi, all compretes and all plants, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                            Detecting fungal infection of soil or vegetables by Microcentrospora acerina, Fibularhizoctonia carotae or Pythium species by treating the sample of soil or vegetable and effecting a PCR on DNA released by lysis of the fungal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Specifically claimed are antisense oligonuclectides capable of modulating the expression of GPAT, and which comprise any of the 30G sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothioate oligonucleotide with 2. MOE wings and a deoxy gap, these
                                                                                                                                                                            New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding glutamine-fructose-6-phosphate amidotransferase (GFAI), for treating diabetes, a cardiovascular or neurologic disorder, ischemia/reperfusion injury.

The present invention relates to a compound which specifically hybridizes with a nucleic acid molecule encoding GFAT, and inhibits the expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 30G3 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'-MOE wings and a decoyy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SF-25 antigen; magnetic bead; cancer; cancer diagnosis; PCR; primer; 4F2;

                                                                                                                                                                                                                                                                                                                                            4F2
                                                                                                     The invention relates to detecting cancer cells and involves isolating cancer cells expressing SP-25 antigen on cell surface from a living body for bonding to magnetic beads with use of antigen-antibody reaction of the cancer cell and anti SP-25 antibody or its antigen-binding fragment, collecting the beads and examining the bound cancer cells. The method is collecting the beads and examining the bound cancer cells. The method is including leukemia. The method is convenient and efficient, without needing any special equipment like cell sorrers. The present sequence represents a PCR primer used in measuring the expression level of the 4F?
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /mod_base= OTHER

The invention relates to a novel antisense compound where the compound hybridises to and inhibits expression of mRNA encoding human apolipoprotein B (ApoB) after 16-24 hours by at least 18% in 80% confound the invention demonstrates cardiovascular, antiated compound of the invention demonstrates cardiovascular, antiated compound of the invention demonstrates cardiovascular, antiated compound of the invention demonstrates cardiovascular, compound of the invention demonstrates cardiovascular, cardiant, vasotropic, national catholic, eating disorder-related, cytostatic, candocrine, vasotropic, neuroprotective and nootropic activities and may consocrated for inhibiting the expression of apolipoprotein B in cells or tissues in vivo in order to address a condition associated with abnormal lipid or cholesterol metabolism. The compound may be useful for cholesterol metabolism. The compound may be useful for cholesterol levels, lipid levels, fatty acid levels, acute phase cholesterol and chylomicrons and thus may be utilised during treatment of reactants and chylomicrons and thus may be utilised during treatment of syndrome, sexual ateliotic dwarfism, hyperthyloxidism, hypertension, cardiovascular disorders, Von Gierke's disease, lipodystrophy, componence, obstructive liver disease, Altheimer's disease, dementia, diabetes, obesity and atherosclerosis. The current sequence is that of an expense 2'-now Dayn Dayn Dayn Dayner 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 apolipoprotein B; ApoB; cardiovascular; antiarteriosclerotic; antilipaemic; antidiabetic; anorectic; cardiant; vasotropic; hypotensive; anabolic; eating disorder; cytostatic; endocrine; vasotropic; neuroprotective; nootropic; lipid; cholesterol metabolism; hyperlipoproteinaemia; hyperlipidsemia; hypercholesterolaemia; von Gierke's disease; lipodystrophy; Cushing's syndrome; sexual ateliotic dwarfism; hyperthyroidism; hypertension; anorexia nervosa; Werner's syndrome; hepatcoma; multiple myeloma; uraemia; impotence; obstructive liver disease; Alzheimer's; dementia; diabetes; obesity; atherosclerosis; antisense; 2'-MOE gapmer; 2'-methoxyethyl wing;

The invention relates to a novel antisense compound where the compound hybridises to and inhibits expression of mRNA encoding human apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80% confluent HepG2 cells in culture at a concentration of 150 nM. The compound of the invention demonstrates cardiovascular, ancretics. Cardiant, anitateriosclerotic, antilipaemic, antidiabettc, anorectic, cardiant, carotropic, hypotensive, anabolic, eating disorder-related, cytostatic, cordine, vasotropic, neuroprotective and nootropic activities and may be useful for inhibiting the expression of apolipoprotein B in cells or citissues in vivo in order to address a condition associated with abnormal cordinates in vivo in order to address a condition associated with abnormal cordinates in vivo in order to address a condition associated with abnormal cordinates in vivo in order to address a condition associated with abnormal cordinates of inpid or cholesterol metabolism. The compound may be useful for decreasing circulating lipoprotein levels, triglycelide during treatment of hyperlipoproteinaemia, hyperlipodystrophy, Cushing's cordinovacular disorders, von Gierke's disease, lipodystrophy, Cushing's syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertenaion, cordiabetes, obesity and atherosclerosis. The current sequence is that of antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is trageted to human ApoB RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         apolipoprotein B; ApoB; cardiovascular; antiarteriosclerotic; antilipaemic; antidiabetic; anorectic; cardiant; vasotropic; hypotensive; anabolic; eating disorder; cytostatic; endocrine; vasotropic; hypotentorotective; nootropic; lipid; cholesterol metabolism; hyporlipoproteinaemia; hyperlipidaemia; hyperlipidaemia; hypersthopy; Cushing's syndrome; sexual ateliotic dwarfism; hyperthyroidism; hypertension;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human apolipoprotein B (ApoB) antisense therapy target DNA - SEQ 517.

The invention relates to a novel antisense compound where the compound hybridises to and inhibits expression of mRNA encoding human appolipation in (Appoliter) (1-24 hours by at least 30% in 80% confluent HepGZ cells in culture at a concentration of 150 nM. The comfound of the invention demonstrates cardiovascular, confluent HepGZ cells in culture at a concentration of 150 nM. The compound of the invention demonstrates cardiovascular, confluent HepGZ cells in culture at a concentration of 150 nM. The compound of the invention demonstrates cardiovascular, cardivities and may be useful for inhibiting the expression of apolipoprotein B in cells or tissues in vivo in order to address a condition associated with abnormal lipt or cholesterol metabolism. The compound may be useful for cholesterol metabolism. Input levels, triglyceride levels, cholesterol levels, lipid levels, fatty acid levels, acute phase creations and chus may be utilised during treatment of hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, cardiovascular disorders, won Giarke's disease, lipodystrophy, Cushing's syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension, cardiovascular disease, dasease, damentia, chapters, obesity and atherosclerosis. The current sequence is that of a human apolipoprotein B (ApoB) antisense therapy target DNA of the human ApoB gene is located at chromosome 2p23-2p24.
anorexia nervosa; Werner's syndrome; hepatoma; multiple myeloma; uraemia; impotence; obstructive liver disease; Alzheimer's; dementia; diabetes; obesity; atherosclerosis; human; chromosome 2p23-2p24; ds;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New compounds, particularly oligonuclectides targeted to a nucleic acid encoding DR1-associated protein 1, useful for treating diseases associated with DR1-associated protein 1, e.g. developmental disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is directed to antisense oligonucleotides targeted to DRL-associated protein 1 (also known as DRAPL and negative cofactor (alpha (NC2-alpha)) and which modulates to the expression of DRL-associated protein 1. The invention is useful for treating a disease or condition associated with DRL-associated protein 1 such as developmental disorder. The present sequence is human DRL-associated protein 1 antisense oligonucleotide. This sequence is used in the
DR1-associated protein 1; DRAP1; negative cofactor 2 alpha; NC2-alpha; developmental disorder; therapy; human; antisense; phosphorothioate backbone; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ADP84331/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                        The invention describes the efficient amplification of at least one template nucleic acid (A) comprising PCR amplification, in the presence, from the start, of a competitor (I) that inhibits formation of one of the template strands amplified by PCR. Also described is a method for cemplate strands amplified by PCR. Also described is a method for cemplate strands amplified by PCR. Also described is a method for convex then detecting the amplification product by hybridisation or with a complementary probe. The method is used to amplify nucleic acids for subsequent detection by hybridisation, particularly in a microarray format, e.g. for diagnosis, especially genetic analysis; analysis of single-nucleotide polymorphisms; detection of microarganisms and/or of viral pathogens It can also be used for real-time quantitative PCR (by cyclic repetition of the amplification and hybridisation steps). The method provides quantitative, microarray based analysis; involves fewer crept steps (amplification and detection are done as a continuous process) and has a lower error rate. The process can be done in a closed vessel and controdies a small, easily handled, system for point-of-care diagnosis. Although (I) reduces the amount of amplification product formed, it increases the hybridisation signal. This sequence represents an objection accordance of the

The invention describes the efficient amplification of at least one template nucleic acid (A) comprising PCR amplification, in the presence, from the start, of a comperitor (I) that inhibits formation of one of the template strands amplified by PCR. Also described is a method for template strands amplified by PCR. Also described is a method for new process then detecting the amplification product by hybridisation with a complementary probe. The method is used to amplify nucleic acids for subsequent detection by hybridisation, particularly in a microarray formal pathogens. It can also be used for real-time quantitative PCR (by viral pathogens. It can also be used for real-time quantitative PCR (by cyclic repetition of the amplification and hybridisation steps). The method provides quantitative, microarray-based analysis involves fewer steps (amplification and detection are done as a continuous process) and has a lower error rate. The process can be done in a closed vessel and provides a small, easily handled, system for point-of-care diagnosis.

Although (I) reduces the amount of amplification product formed, it increases the hybridisation signal. This sequence repersents a primer of increases the hybridisation signal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Efficient amplification of template nucleic acid, useful e.g. for genetic analysis or detecting microorganisms, uses a competitor that inhibits amplification of one template strand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rev PCR primer used for sequencing exon 2b.1 boundary of human GPRA DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 increases the hybridisation signal. This sequence represents a primer associated with the amplification method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  G-protein coupled receptor for asthma susceptibility; AAA1; asthma associated alternatively spliced gene 1; primer; PCR; chronic obstructive pulmonary disease; cancer; rhinitis; dermatitis; cytostatic; antiasthmatic; transgenic; asthma locus-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              pharmaceutical compositions exhibit cytostatic and antiasthmatic activities. Furthermore, it provides a transgenic animal comprising the asthma locus-1 (AST-1) DNA. This oligonucleotide sequence is a PCR primer used to sequence the exon and exon/ intron boundaries of human GPRA DNA, given in table 5 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       locus AST-1 for asthma and other ign mediated diseases mapped to the human chromosome 7p14-p15. Specifically, it refers to two overlapping genes namely GPRA (G-protein coupled receptor for asthma susceptibility) and AAA1 (asthma associated alternatively spliced gene 1). The present invention describes identifying single nucleotide polymorphisms, as well as insertion or deletion polymorphisms, occurring at different positions in the AST-1 locus, and furthermore providing vectors, host cells, primers and probes in order to determine the status of an individual. Accordingly, it provides a kit to diagnose or assess predisposition to asthma, chronic obstructive pulmonary disease or cancer and other IgE mediated diseases including rhinitis and dermatitis, such that derived
                                                                                                                                                                                                                                                                                                                                       New GPRA polypeptides, useful in preparing a composition for diagnosing, treating or preventing asthma, other IgE-mediated disease, chronic obstructive pulmonary disease or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to the identification of a novel susceptibility

Prepn. of fusion proteins contg. ballast constituent and protein - giving
                                                                                                                                                                                                                                                                                                                                                                                                  Sequence AAQ51806 is a specific example of the novel generic ballast constituent coding sequence. The invention covers fusion proteins in which a short ballast constituent is fused to a desired protein, esp. to modified pro-insulin, to increase recombinant production of the protein. See AAQ51798-Q51799 and AAQ51802-Q51811
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inhibitor; inhibition; ribozyme; treatment; prevention; psoriasis; asthma; inflammatory diseases; restenosis; cardiovascular condition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic RNA molecules which cleave mRNA - used to treat or prevent inflammatory, arthritic, stenotic or cardiovascular diseases or conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Specific; cleavage; target RNA; protein; prophylaxis; expression;

A new method for the detection of nucleic acids comprises (a) amplifying a DNA by PCR using primers to which an appropriate RNA polymerase promoter has been appended; (b) transcribing the amplified DNA into RNA using an RNA polymerase; (c) forming RNA:DNA hybrids; and (d) immunochemically detecting the RNA:DNA hybrids using antibodies directed to RNA:DNA hybrids using antibodies directed to RNA:DNA hybrids using antibodies directed the RNA:DNA hybrids using antibodies directed the RNA:DNA hybrids using antibodies directed from the hlyA gene and spanned a 730 base pair region of the gene from nucleotides 602-1332. Por further use in the invention, the primer described in AAT42247 had an additional 26 nucleotides added to it
                                                 This is a c-myb mRNA target sequence (nucleotide no. 1919) of an enzymatic RNA molecule (ribozyme) which cleaves mRNA associated with the development or maintenance of a restenotic condition. The concr. of the ribozyme necessary to effect a therapeutic treatment is lower than that of an antisense oligonucleotide and the specificity of action is higher. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           corresponding to 17 RNA polymerase promoter sequence. The resulting primer is described in AAT42249
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection of nucleic acid sequences - by polymerase chain reaction amplification, transcription using RNA polymerase and detection of RNA:DNA hybrids using antibodies.

This invention relates to novel oligonucleotide PCR primers which may be used to identify markers associated with genetic diseases and traits in dogs, in particular to disgnose genetic diseases that are not phenotypically visible and to identify carriers of recessive diseases. A specific application is diagnosis of copper toxicosis (CT). The invention can also be used to create a genetic map of the canine genome; to generate breed specific profiles; to establish paternity and to identify dogs from DNA fingerprints. The method provides rapid analysis of the target sequences from only a small sample of DNA. Diagnosis can be done at any time in the dog's life. The present sequence is that of a PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotide primers for diagnosis of genetic diseases and trait in dogs - amplify specific regions of the genome containing microsatellite repeats, especially for diagnosing copper toxicosis and

                                                                                                                                                                                                                                                                                                                                                                                    AAV51705-V5200B are reverse PCR primers used to amplify fragments of the Zea mays genome in order to detect polymorphic markers. Such markers can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant

AAV51705-V52008 are reverse PCR primers used to amplify fragments of the Zea mays genome in order to detect polymorphic markers. Such markers can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a backcrossed plant with an ancestral plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.

AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human egenome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyham syndrome, muscular cyptrophy, Wiskott-Aldrich syndrome, Pabry's disease, familial cyptrophy, Wiskott-Aldrich syndrome, Pabry's disease, hereditary hypercholesterolemia, polycystic Kidney disease, hereditary cyptropis, von Willebrand's disease, tubercous sclerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmume diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obseity), strength, speed, endurance, ferrility, and susceptibility or receptivity to particular crugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ATP binding cassette, ABC transporter, ABCR; Stargardt Disease, therapy; Fundus Flavimaculatus; age-related macular degeneration; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
```

This sequence represents a PCR primer for DNA encoding the human retina

```
ANY62007-V62009 are PCR primers used in a novel method for the enhanced detection of DNA sequences, via a nucleic acid amplification procedure, especially for detecting pathogens. Minute samples of pathogens (c. 10 cells) cannot be detected effectively by PCR. The minute quantities of product formed by PCR are then transcribed into RNA enhancement products, which further amplifies the target sequences to detectable levels. Detection then takes place with antibodies for DNA:RNA hybrids, which enable detection if the product volume formed is still small, but is specific enough just for this type of product. The method is especially useful for detecting the following pathogens: Listeria monocytogenes, L. innocua, L. ivanovii, L. seeligeri, L. welshimeri, L. murrayi, L. grayi, inconcus thermophillus, Lactobacillus casel, Lactococcus lactis, Micrococcus thermophillus, Lactobacillus casel, Lactococcus epidermidis, Micrococcus Luteus, Enterococcus epidermidis, Bacillus subtilis, Pseudomonas aeruginosa, Escherichia acil, Salmonella typhimurium, or Yersinia enterocolitica.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection; pathogen; amplification; RNA enhancement product; PCR primer; DNA/RNA hybrid; Listeria sp; Streptococcus sp; Lactobacillus sp; Lactococcus sp; Micrococcus sp; Entercoccus sp; Stapylococcus sp; Bacillus sp; Pseudomonas sp; Escherichia coli; Salmonella typhimurium; Yersinia enterocolitica; ss.
              may be used in compositions for screening agents that alters ABCR. The agent can inhibit Stargardt Disease, Fundus Flavimaculatus and agerelated macular degeneration (MD). Primers (such as this sequence) and probes for the ABCR DNA can be used in a diagnostic kit for detecting MD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Enhanced detection by nucleic acid amplification, especially of Listeria - uses formation of DNA-RNA hybrids after amplification, and then

This invention describes a novel method for identifying an inhibitor of potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the precancerozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the cormal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic essions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZSSB12-ZSG825 represent human polymorphic sites described in the method of the invention

The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele present in cells of the precancerous condition, where the normal somatic cells of the precancerous condition, where the normal somatic sessent in cells of the precancerous condition, where the normal somatic cells of the precancerous condition, where the normal somatic is active on at least one but less than all allelic forms of the gene present in a population and traspets only one allelic forms of the gene promal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and
                                                                                                                                                                                                                                                                                                                                                                                                                           cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalignant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     malignant cells from bone marrow transplants. AA225812-226825 represent human polymorphic sites described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene hormal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lessions, benign tunours, endometriosis, polycystic kidney disease, and

                                                                                                                                                                                                                                               replication. Optionally the oligonucleotides include at least one 2'-(2-methoxy) sugar modification or phosphorothioate internucleotide linkages. The oligonucleotides are used to inhibit CMV infections (by in vivo or in vitro contact with cells, tissues or body fluids), especially
New antieense oligonucleotides that target cytomegalovirus nucleic acid particularly including 2-methoxyethoxy sugar modifications, especially for treating viral retinitis, with long-lasting retention in the retina.
                                                                                                                                                            Antisense oligonucleotides (AAX17861-X17924) are targeted to a nucleic acid (AAX17925-X17948) encoding IE (immediate early) 1 or 2, or DNA polymerase of cytomegalovirus (CMV) and are able to inhibit CMV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human integrin beta 3 quantitative real-time PCR primer, SEQ ID NO:3.

Sequences AAZ59305-Z59352 are fragments of the human STP2 gene. The fragments are from the 8 exons, the promoter region, 3' and 5' untranslated regions of the STP2 gene. Each sequence contains a newly identified STP2 gene single nucleotide polymorphism (SNP). STP2 is a phenol sulphotransferase. Substrates for STP2 include minoxidil, actenaninophen, and paranitrophenol. Several of the modified changes identified at the polymorphism sites, give rise to an amino acid change may result in altered enzyme activity. The sequences of mino acid changes for detecting STP2 polymorphisms. The polymorphic probes are used in screening and genotyping, i.e. to predict the rate of metabolism of STP2 substrates, potential drug-drug interactions and adverse side effects. They can also be used to detect diseases resulting from accidental or occupational expense to toxins and to establish animal, cell or in vitro models for drug metabolism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human biallelic marker downstream amplification primer SEQ ID NO:8100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel nucleic acid used for genotyping, e.g. to predict rate of drug

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences AAA07029-A07030 represent human integrin beta 3 PCR primers used in quantitative real-time PCR with probe AAA07031 in an exemplification of the present invention. The invention relates to antisense oligonucleotides targetted to the human integrin beta 3 gene, which inhibit its expression. A series of oligonucleotides (AAA07035-AAA07074) were designed to target different regions of the human integrin beta 3 RNA, and were analysed for their effect on integrin beta 3 mRNA, levels by quantitative real-time PCR. GAPBH (qlyceraldehyde-3-phosphate) mRNA levels were measured as a control. Integrins constitute one of four Classes of cellular adhesion molecules, and play an important role in cell migration, cell anchorage to substrates and cytoadhesion signalling pathways. They are heterodimeric cation-dependent membrane glycoproteins composed of an alpha and beta subunit. Integrin beta 3 (also known as human endothelial glycoprotein, GP3A, GPIIIa, ITGB3, CD61 and platelet glycoprotein 3a) is the common beta subunit partner of the members of the beta-3 subfamily of integrins. This family consists of the vitronectin ceptor (alpha-V-beta-3) and the fibronectin receptor (alpha-IIb-beta-23). Cells expressing this class of integrin can adhere to various matrix process. Integrin beta 3 is implicated in conditions such as vascular response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          restenosis, excessive bone resorption, angiogenesis (in melanoma), tumour invasion, platelet aggregation and Glanzmann's thrombasthenia. The oligomucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with integrin beta 3 expression, such as tumour formation, inflammation, infections and the diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound that inhibits human integrin beta3, useful e.g. for treating or preventing infection, inflammation and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .,

                                                                                                                                                                                                                                                                                                                                                  AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nuclectide sequences. AAZ69579 to AAZ7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the mann genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment. The present invention describes a chimeric virus comprising influenza virus containing a heterologous RNA segment from another strain of influenza virus or 8 genomic segments from different strains of influenza virus, with each segment comprising the reverse complement of a mRNA coding sequence operatively linked to a binding site specific for an RNA-directed RNA polymerase of a negative strand RNA virus. The recombinant negative strand virus RNA templates may be used to express heterologous gene products in appropriate host cell systems and/or to construct recombinant viruses that express, package and/or present the heterologous gene product. The expression products and chimeric viruses may be used in vaccine formulations. ANYS7746 to AAX556234 to AAX56290, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; vencus thromboembolism; pulmonary embolism; paternity test; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Chimeric virus containing influenza virus RNA segments, useful for expressing heterologous gene products in appropriate host cell systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /*tag= a

                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                                             genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, mycoradial infarction, coronary heart disease, stroke, perhipheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                            The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

                                                                                                                                                                                                                                                                                                                            The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.
                                                                                                        Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis.
   Mccarthy JJ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mccarthy JJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /standard_name= "single nucleotide polymorphism"

contain single nucleotide polymorphisms (SNPs). A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diseases, diseases of the carditovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmacutical. SNP containing oligonucleotides are also useful in an asphications such as phenotype correlation, forensics, paternity testing, medicine and genetic analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nucleotide polymorphisms (SNPs).                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                   disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                 The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis
                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
               Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Single nucleotide polymorphism; SNP; human; cancer; inflammation; heart disease; paternity testing; forensic science; ds.

This is a tryptase like protein which is highly expressed in contractile tissues. The sequences can be used in the treatment and identification of treatments for cardiovascular disease, inflammation, infertility, male reproductive dystunction, asthma, stroke, immune disorders and gastrointestinal disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful
diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in applications such as phenotype correlation, forensics, paternity testing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mouse; ztrypl; serine protease; tryptase; inflammation; fertilisation; cardiovascular disease; infertility; asthma; immune disorder; stroke; gastrointestinal disorder; testicular function; contraceptive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides the protein and coding sequences of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primers AAF90246-47 were used to amplify a DNA probe for DNA encoding a UDP-glucose.aglycon-glucosyltransferase (UDP-GAG) polypeptide. The enzyme conjugates a cyanohydrin, terpenoid, phenylderivative or hexanolderivative to glucose. UDP-GAG polynucleotides are useful for producing transgenic plants having modified cyanogenic glucoside biosynthesis. Constitutive, inducible or tissue-specific expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          UDP-GAG is useful for obtaining transgenic cyanogenic plants with altered resistance to pathogens and herbivore responses
                                                                                                                                                                                            UDP-glucose:aglycon-glucosyltransferase; UDP-GAG; cyanohydrin; terpenoid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA molecule coding for UDP-glucose:aglycon-glucosyltransferase conjugating cyanohydrin, terpenoid or phenylderivative to glucose, for producing transgenic plants having modified cyanogenic glucoside
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The specification describes a ribozyme capable of inhibiting oestrogen-dependent tumour cell proliferation and having a high substrate specificity for an mRNA sequence encoding a DNA-binding domain of human oestrogen receptor. The ribozyme is free of endonuclease activity for an mRNA having a DNA binding domain of a glucocorticoid. The oestrogen receptor site-specific ribozymes are useful for cancer treatment and therapies, especially for inhibiting oestrogen-dependent tumour cell proliferation, particularly breast cancer. The present sequenc represents the critical sequence of a ribozyme of the invention, which targets the the DNA binding domain of a human oestrogen receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a construct which allows animals to be bred in captivity but renders them infertile in the wild by allowing reversible control over fertility and reproduction. The construct comprises a native
                       for inhibiting estrogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     fertility; reproduction; gametogenesis; microinjection; infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a primer used to sequence a polynucleotide encoding a human RecQ5 type DNA helicase. The three RecQ5 type helicases alpha, beta and gamma are formed by alternative splicing. The invention discloses the RecQ5 type DNA helicases beta and gamma, and the genes encoding them. The RecQ5 beta DNA helicase has a novel characteristic of being localised in the nucleus. It is useful as a diagnostic marker or in the treatment of diseases associated with chromosomal instability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ribozyme; oestrogen-dependent tumour; cell proliferation; glucocorticoid; DNA-binding domain; oestrogen receptor; cancer treatment; breast cancer;
                                                                                                                                                                                                                                                                                                                                                                                                      Polynucleotide encoding for RecQ5beta helicase useful for diagnosis and treatment of chromosomal instability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Critical sequence of a ribozyme targeting the oestrogen receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;
